

## K.T.S Adapter and bolted attachments

1

The number of makes and models of loaders, telescopic handlers, smaller loaders and skid-steer loaders is constantly increasing. In other words, **the demand** for different brackets for our attachments is growing as well.

It is therefore very important that you **never get fixated** on a certain type of bracket. Next time you change your tractor it might be to a loader or a telescopic handler. That is why all (does not apply to pallet forks where the bracket is a supporting part of the structure) K.T.S attachments in this brochure have **bolted brackets**. Loosen 8 M16 bolts and **simply mount the new bracket!** This is much easier and safer than cutting off the old bracket and welding a new one.

If you have attachments with welded brackets, if you share your attachment with a neighbour or want to use it in the front lift, K.T.S has different adapters. This way it is possible to make e.g. a bale grabber with Euro bracket fit a JCB telescopic handler by means of a K.T.S Adapter.

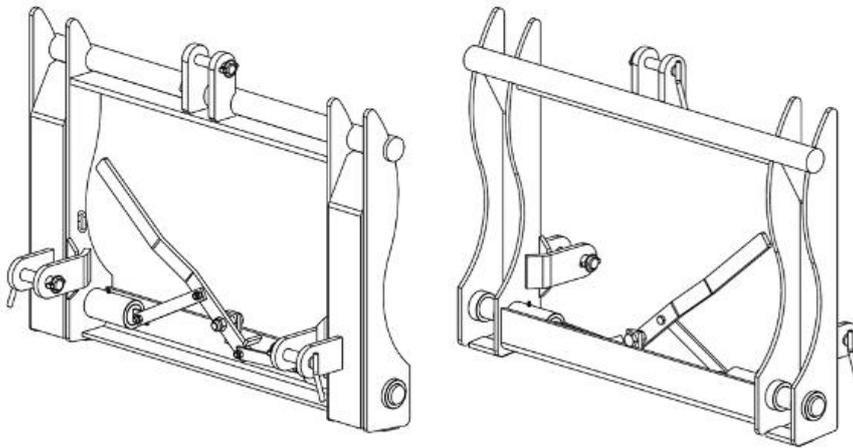

2

**K.T.S has been using bolted brackets for its attachments since the beginning of the 1990s. It has been very well tested over the years, and we know that it will last!**

K.T.S has **two adapter models**: 5.0 t with welded 3-point bracket facing machine and Big Volvo BM facing implement (picture 1) for loaders and 3.0 t (picture 2) for loaders and small loaders.

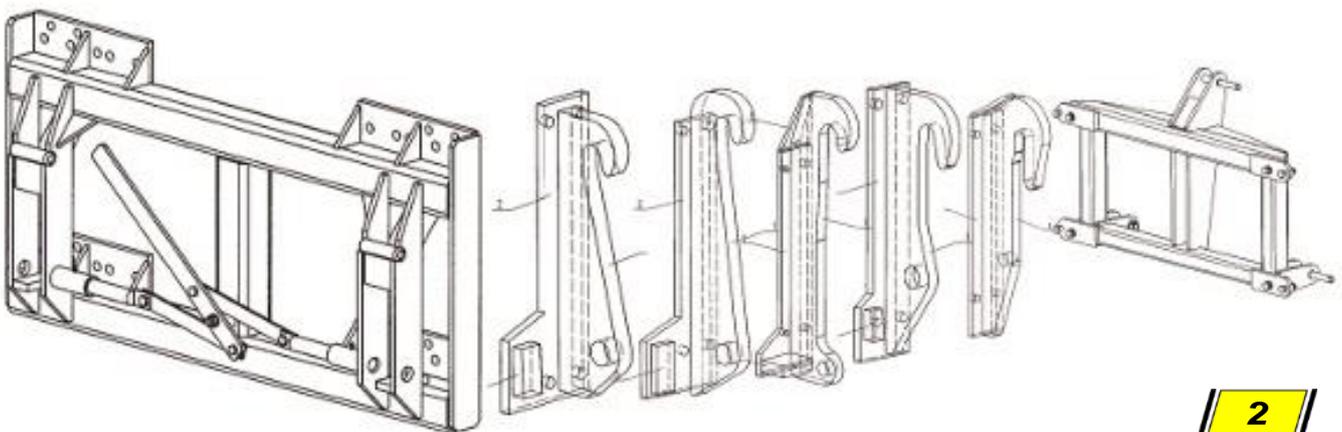

It is very important that you choose an adapter/bracket that corresponds to the lifting capacity of your machine.

On the following pages, we have drawings of standard brackets so that you can identify the bracket you need. Can't find your bracket? Call us and we will be happy to help you!
